PROBLEM STATEMENT

Travel planning is often complex and fragmented, requiring users to search across multiple platforms to choose destinations, accommodations, activities, and bookings. Travelers typically have general preferences such as dates, budget, and interests but find it difficult to convert them into realistic, time-optimized daily itineraries. Additionally, traditional travel planning tools do not adapt well to real-time factors like weather changes, delays, crowd levels, or availability, resulting in inefficient schedules and missed opportunities.

OBJECTIVE

To develop an AI-Driven Tourism Agent Planner that automatically generates personalized, day-wise, and time-aware itineraries based on user inputs. The system aims to optimize activity scheduling, accommodation selection, and booking decisions while dynamically adjusting the travel plan according to real-time conditions, ensuring a practical, seamless, and unified travel planning experience.

Endless_Dreams
AI-Powered Trip Planner

EndLess_Dreams

Unique AI-Powered Features

1. Smart Time-Slot Scheduling - Crowd Peaks
2. Stay Location Optimization
3. Dynamic Re-planning - Weather/Delays
4. Budget Drift Detection - Track Spending
5. Travel Fatigue Model - Pace/Intensity
6. Booking Window Intelligence
7. Plan Confidence Score
8. Real-Time Micro Notifications
9. Explainable AI - Decision Logic
10. Real-Time Micro Notifications
